

CITY LIBRARY — DATA FAIRNESS REFLECTION

=====

1. PURPOSE

The purpose of this analysis is to examine differences in library participation across neighborhoods and identify opportunities for more balanced service engagement.

2. HIGHEST MEMBER REPRESENTATION

Neighborhood: Maadi

Registered members: 20

3. LOWEST MEMBER REPRESENTATION

Neighborhood: Shubra

Registered members: 5

4. REPRESENTATION GAP

Difference in registered members: 15

5. CHECKOUT ACTIVITY

Highest checkout activity:

Maadi — 114 checkouts

Lowest checkout activity:

Shubra — 34 checkouts

6. FAIRNESS INTERPRETATION

The differences observed in the dataset indicate that library participation is not distributed equally across all neighborhoods.

However, the data alone does not establish the reason for these differences or prove that any neighborhood is being treated unfairly.

The results should therefore be interpreted as an indicator for further investigation.

7. RECOMMENDATION

The library could investigate the lower-represented neighborhood through targeted outreach, awareness campaigns, community partnerships, or localized reading activities.

The objective would be to understand possible barriers to participation and improve awareness and access to library services.

8. CONCLUSION

A fairness-aware approach should use data to identify participation gaps while avoiding unsupported assumptions about the communities represented in the dataset.
